*Specification*

The substitute specification filed 7/12/04 has not been entered because a substitute specification was not required by Examiner in the Office Action of 1/4/04. The objection to the specification only required the insertion of appropriate section headings, as specified by 37 CFR 1.77(b). The headings will be inserted by Examiner's amendment.

**EXAMINER'S AMENDMENT**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

In the specification, the heading -- **Background of the Invention** -- was inserted in the line between the title, "CREATINE BIOSENSORS" and the first line of text beginning with, "This invention relates to...". The heading -- **Summary of the Invention** -- was inserted between the last line of section [009] and the first line of section [0010]. The heading -- **Detailed Description of the Invention** -- was inserted between the last line of section [0011] and the first line of section [0012].

The following is an examiner's statement of reasons for allowance: The instant invention is novel and unobvious over Monbouquette (US 6,241,863). Monbouquette discloses several methods of making amperometric biosensors. In one method, one or more enzymes can be deposited upon an electrode having an amphiphilic lipid already deposited on the surface of the electrode followed by cross-linking of the enzymes. In another method, one or more enzymes can be combined with an amphiphilic lipid and then deposited upon an electrode. The deposition of the mixture is followed by cross-linking of the enzymes. These two methods are claimed in claimed 1-13. These methods differ from the instantly

Art Unit: 1651

claimed method in that the enzyme that is combined with an amphiphilic substance is cross-linked to the electrode and there is no further deposition of layers of enzyme(s). Nor is there a suggestion to do so.

Monbouquette also teaches that a population of enzymes can be cross-linked and then deposited onto a lipophilic layer. No further layering is described nor suggested. This method is claimed in claims 17-19 and the result is depicted in Figure 13.

Monbouquette also describes a method of layering enzymes on an electrode surface that requires cross-linking in all of the layering steps (col. 13, lines 1-55). This prior art method differs from the instantly claimed method in that the enzyme/surfactant layer that is initially deposited on the electrode is cross-linked to the electrode. The instant method does not require cross-linking of the deposited enzyme on the electrode. Nor does the instant method require that the next layer of enzyme is chemically immobilized "thereupon" which is interpreted to mean that the next layer is connected to the first layer and not the electrode.

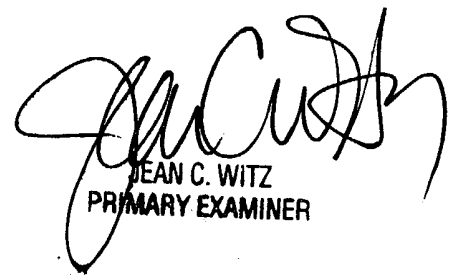

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
